

In the past the Bush régime has placed climatologists under virtual house arrest for the heinous crime of “not making Bush look good”. At a recent international Wildlife Conference of all things, US delegates were forbidden to use the word or mention the concept of “climate change”. This in “the world’s greatest democracy”. The former “citadel of freedom”.

The problem is, as the scientists will tell you if their political minders are not around, that if things continue as they are for very long, we will reach a point of no return. Beyond which nothing we can do will save us from extinction. The temperature will reach a point not seen for 4 billion years. There will be nothing left. And our tortuous, wonderful 3.65 billion journey to thinking life will have been for naught.

I know this will please some religious zealots, but why do they need to take the rest of us with them on their rapturous journey through the flames of hell?

We can stop the warming process at some level where life will still be bearable. And when we have done that we will also find a way to begin to restore conditions as they were. To think this is not possible is to deny that we are a thinking specie. Capable of thinking and learning. When we have changed our societal system and stopped global warming we will have proven that.

But we will not able to do any of this until we realize the we are in fact a thinking specie. And begin to act like one. Each of us unique and different from all others. With differing hopes and dreams for our lives. And differing abilities to implement and realize these hopes and dreams. Further, that this is dynamic process, constantly changing throughout life. That this in fact defines and is the essence of individual thinking life. That anything else is a travesty on the concept of thinking life, yes...?

That we do this by each of us assuming total responsibility for our own life. For the action and results of our life. That we may do anything that does not intentionally interfere in the life of another thinking being. That to act rationally and morally is the basic obligation and duty of individual thinking life.

Then each individual, as a matter of individual self-interest, seeks to keep their carbon footprint at a designated level. That is they think they can do this better and have a better life elsewhere in the world, they simply go there.

For me, the definition of *globalization* is:

“The societal condition that exists when any individual may trade with any other individual based *solely* on mutually agreed terms and conditions.”

This is also synonymous with universal freedom and free trade.

Unless we curtail our emissions *now*, we will reach a point of no return. At which *nothing* we can do will save us from extinction. Therefore, we must think as if an astroied will hit us by, say, 2050. That if we reduce planetary emissions to a certain level by, say, 2015, we can survive. But we can do this *only* through the concept of total individual freedom and responsibility for the results of individual thinking life.

**When this exists we can and will solve the problem of our societal structure and of global warming. Retaining our beautiful blue planet.**

“Global warming is on the rise, the war on terrorism seems to have no ending, and politicians are once again involved in scandals. What can we do? Plenty, says author William W Morgan in his groundbreaking new book...

“Morgan focuses on global warming, which he emphatically states is caused by man, and attacks the damage that has been orchestrated by the Bush administration...

“Fierce, angry and provocative...”

“Brilliantly stated, this is a book that just could change the world”.

**Ellen Tanner Marsh, *New York Times* best-selling author.**

## The Technical Message

Add 1.8 degrees Fahrenheit—1 degree Celsius—to the current average temperature.

- Between 400 million and 1.7 billion more people can't get enough water
- Infectious diseases and allergenic pollens rise.
- Sea levels may rise by one meter.

Add another 1.8 degrees F, which would happen around 2050.

- As many as 2 billion people could be without water and about 20 percent to 30 percent of the world's species near extinction.
- More people start dying because of malnutrition, disease, heat waves, floods and droughts. Not to mention panic, riots, societal chaos.
- Sea levels may rise by a further three meters, to a total of four meters.

At the extreme end of the projections, a 7- to 9-degree average temperature increase

- Up to one-fifth of the world population affected by increased flood events
- Up to 3.2 billion people with increased water scarcity
- Major extinctions around the globe
- Sea levels may rise by a further sixty meters. And it is too late...

And you know what happens in anything in which politicians are involved. There are cost over-runs, budget deficits, ten year plans that solve nothing. So we should expect that the most dismal forecast will happen. Or more likely, worse than anyone imagined. A political conference is like a black hole: no light allowed in or out. After all, it is a "closed door" meeting, yes? To protect the guilty...

Such as in Bush's Blunder and his "solution" to the problem of terrorism. The creation of the Axis Powers, the Bush to Blair to Aznar to Howard axis. The spending of more than \$1 trillion, Perhaps a million lives lost. Vast amount of property destroyed. Billions of tons of additional greenhouse gases in the atmosphere. And terrorism is worse, not better.

Yet with this there is a second chance. Everyone can pull out. The Palestinian lands returned to them, No further interference in the Middle East by any of the Western powers. And terrorism will slow down as individuals are left alone to solve their own problems.

With Global Warming there will be no second chance. We cross a threshold, after which there is nothing we can do prevent our extinction. No "executive order", no "political consensus" will change that.

## The Reality Take

The reality is that politics has never solved even one of our societal problems. Rather, they become ever-more endemic and intractable, yes? You watch or listen to the news? You tell me.

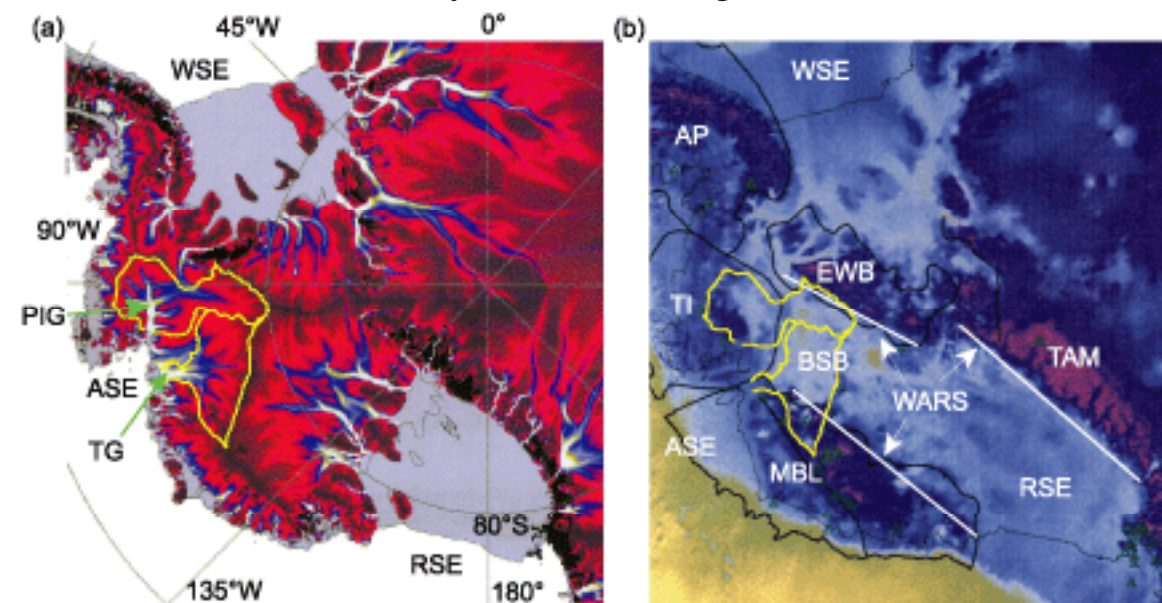

Do you think those who have never made healthcare, pension or school systems work... can not solve the problems of unemployment, crime, globalization, hunger, famine and malnutrition... make the trade system work... prevent war and terrorism.

What makes you think they can handle something vastly more complex than any of those?

They indict themselves as incompetent and devious in the very report we are now talking about. The IPCC Climate Change Report. In which China, Saudi Arabia and the US fought to and succeeded in "watering down reality". Which admittedly does take talent. To water-down reality? And meddled even in the details. Some scientists walked out in protest.

## The Biblical Flood: Global Warming & Bush's Harvest

By William W Morgan

Context maps of West Antarctica showing its three major ice drainages: the Amundsen Sea Embayment (ASE), the Ross Sea Embayment (RSE) and Weddell Sea Embayment (WSE). The Amundsen Sea Embayment—the place where the biggest change is occurring—is 2 miles (3.2 kms) thick, and the size of the American state of Texas. Larger than many countries. It alone holds enough water to raise sea levels 10 feet (3 meters). Only one of many ice sheets and glaciers melting.

We have never solved one of our societal problems in 5,000 years of trying. Healthcare, pension and school systems do not work. There is famine, hunger, crime, unemployment and trade problems. And Bush's ignorant, knee-jerk reaction to 9-11 increased terror rather than reducing it. At a cost of 3,000 American lives and hundreds of thousands of Afghans and Iraqis. What does this have to do with Global Warming and its societal effects? A lot, actually...

As the same people who have never been able to solve anything and can never agree on anything will now be charged with solving the problems that will result from Global Warming. And these will be horrendous. If you feel terror now, it will be much starker when up to 2 billion people are up-rooted from their homes, land and businesses by the effects of Global Warming.

More than 2,000 "climatology-related" scientists from more than 130 countries are now certain that manmade pollution is creating global warming. They have no doubt that temperatures and sea levels will rise. No doubt there will be both desertification and flooding. With an increasing number of storms of increasing intensity. Rain forests spontaneously bursting into flames. The only thing they do not know is the exact amount and when. Yet they do know that even the minimum will be devastating for mankind. That if we do not cap emissions within the next couple of years at latest (2010 at the outside...), there is a very real danger we—Homo sapiens—will become extinct within as little as thirty years or probably not more than 100 years. That is you, I and everyone else on this planet. We can cross a threshold after which there is no return. Nothing we can do prevent our own extinction.

What do you think will happen, when 30% of the planetary population is uprooted? Most of the major ports do not work. There are ice storms and heat waves. Food supplies disrupted and even vanishing. Katrina represents less than 5% of what will happen to the US. Which will be repeated in Europe, Asia, South America. Africa may be somewhat spared. Maybe we can all move there? But, alas, no visa. The planes are full and few ships operating. **However there is a solution.**

**Which is the subject and content of this book.**
